NOTE-1) An SQL-implementation is required to supply at least one binding to a standard host language using either module language, embedded SQL, or both. This can be through the support of any of the features B011 through B117.

NOTE-2) The ability to associate multiple host compilation units with a single SQL-session at one time.

NOTE-3) This means the support of CAST, where relevant, among all supported data types.

NOTE-4) Including its use in UPDATE and INSERT statements.

NOTE-5) This form of flagging identifies vendor extensions and other non-standard SQL by checking syntax only without requiring access to the catalog information.

NOTE-6) "Routine" is the collective term for functions, methods, and procedures. This feature requires a conforming SQL-implementation to support both user-defined functions and user-defined procedures. An SQL-implementation that conforms to Core SQL shall support at least one language for writing routines; that language may be SQL. If the language is SQL, then the basic specification capability in Core SQL is the ability to specify a one-statement routine. Support for overloaded functions and procedures is not part of Core SQL
